Abstract

This work presents a parallel system for automounted filesystem navigation in a UNIX environment, whose main idea is to report on all automountable files and directories by browsing through NIS and local maps available to a system. In others words, nothing is really mounted as a consequence of the tool's use, allowing for quick access and minimizing cross-mountings among NFS servers, as well as the side effects deriving from this interdependency.

Resumo

Este trabalho apresenta um sistema paralelo para navegação de
